

ANTI-VIRAL FOGGING

- 30 days protection
- Cannot be cleaned off
- 99.99% effective against known pathogens

ZOONO®

Why is protecting surfaces important?

It is widely acknowledged that both the environment and surfaces are a significant source of microbiological contamination and are considered a major vector for harmful microorganisms to cause infection.

Typical routine liquid disinfectants only works for shorter periods of time.

Anti-fogging treatment

The Zoono® treatment involves spraying clean dry surfaces – both hard and soft with a fine mist of product which then dries in situ and provides a mechanical, rather than chemical, **protection against pathogens for the following 30 days**. The product is water based yet cannot be cleaned off even with abrasive chlorine-based cleaners thus providing lasting protection and peace of mind.

Zoono® is the only treatment available which can provide lasting protection against known pathogens, on all touchpoint surfaces providing reassurance to staff and visitors alike that the building is protected to a level that no other product available can achieve.
